## Claims:

1. A method for controlling operation of an assisted ventilation device supplying pressurised gas to a patient, the method comprising the steps of:

determining a relatively longterm average of pressure of gas supplied to said patient; and

controlling the pressure supplied by said ventilation device with regard to said longterm average.

2. A method for detecting the occurrence of a potential or actual overpressure during assisted ventilation, comprising the steps of:

determining a relatively longterm average of ventilation pressure; and determining whether the average approaches or exceeds a threshold value as being indicative of a potential or actual overpressure occurring.

- 3. A method as claimed in claim 2, comprising the further step of issuing an alarm upon the determination of a potential or actual overpressure occurring.
- 4. A method for controlling operation of an assisted ventilation device supplying pressurised gas to a patient, the method comprising the steps of:

measuring the currently delivered pressure;

determining a relatively longterm average of the measured pressure;

comparing said average against a threshold value; and

if the threshold value is approached or exceeded, controlling the pressure supplied by the device.

- 5. A method as claimed in claim 4, wherein said controlling step includes limiting or reducing supplied gas pressure to the patient.
- 6. A method as claimed in claim 5, wherein, for the case of reducing supplied gas pressure, the reducing step is a non-linear function of time and/or pressure.
- 7. A method as claimed in claim 6, wherein the degree of reduction is greater as said threshold value is approached.

- A method as claimed in any one of claims 4 to 7, wherein, for the case 8. of said longterm average exceeding said threshold, said determining step includes a condition that said excess must occur for a minimum period of time before it is determined that a potential or actual overpressure is occurring.
- A method for controlling operation of an assisted ventilation device supplying pressurised gas to a patient, the method comprising the steps of: determining a (relatively longterm average) of supplied pressure; and controlling said supplied pressure as a function of a waveform template, a target patient ventilation and said longterm average.
  - A method as claimed in claim 9, wherein said function is given by: 10.

$$P = P_0 + k.A.f(v,t)$$

where:

10

15

20

25

P is said supplied pressure,

 $P_0$  is a constant pressure,

9.

K is a function of said longterm average.

A is a function of said target patient ventilation, and f(v,f) represents said waveform template.

- A method as claimed in claim 9, wherein, in said controlling step, 11. when said longterm average approaches a threshold value, strong control of said supplied pressure is provided.
- A method as claimed in any one of claims 4 to 11, wherein said longterm average is of the order of minutes.
- A method as claimed in/any one of claim 4 to 11, wherein said 13. longterm average is taken over ten or more breaths.
- Assisted ventilation apparatus for detecting a potential or actual 14. overpressure condition, comprising:

15

20

a blower to supply pressurised gas to a conduct, and in turn to a patient mask for connection with the entrance to a patient's airways:

a pressure sensor to detect the delivered pressure of gas in the conduit or at the mask, and provide a signal thereof; and

- a controller receiving said pressure signal and having control over operation of the blower and operable to determine a relatively longterm average of the pressure signal and to control the supplied pressure with regard to said longterm average.
- 15. Assisted ventilation apparatus as claimed in claim 14, wherein said controller controls the supplied pressure as a function of a waveform template, a target patient ventilation and said longterm average.
  - 16. Assisted ventilation apparatus for detecting a potential or actual overpressure condition, comprising:
  - a blower to supply pressurised gas to a conduit, and in turn to a patient mask for connection with the entrance to a patient's airways;
  - a pressure sensor to detect the delivered pressure of gas in the conduit or at the mask, and provide a signal thereof; and
  - a controller, receiving the pressure signal and having control over operation of the blower, and operable to determine a relatively longterm average of the pressure signal, compare the average against a threshold value, and if the threshold value is approached or exceeded, to control the blower and thus the supplied pressure.
- Apparatus as claimed in claim 16, wherein said controller controls the supplied pressure by limitation or reduction.
  - 18. Apparatus as claimed in claim 17, wherein, for the case of reducing supplied pressure, the controller reduces the pressure as a non-linear function of time and/or pressure.
  - 19. Apparatus as claimed in claim 18, wherein the degree of reduction by the controller is greater as said threshold value is approached.
  - 20. Apparatus as claimed in any one of claims 16 to 19, wherein, for the case of said longterm average exceeding said threshold, the controller operates subject

10

 $\mathcal{A}$ 

to the condition that the time in excess must be greater than a minimum period of time before it is determined that a potential or actual overpressure is occurring.

- Apparatus as claimed in any one of claims 16 to 20, further comprising alarm signalling means, coupled to said controller, for indicating that an alarm state exists if the threshold value is approached or exceeded.
  - 22. Apparatus as claimed in any one of claims 14 to 21, wherein said controller determines the longterm average in the order of minutes.
  - 23. Apparatus as claimed in any one of claims 14 to 21, wherein said controller determines the longterm average over ten or more breaths.
